City of Venice Police Officers' Retirement Plan

3rd Quarter 2009

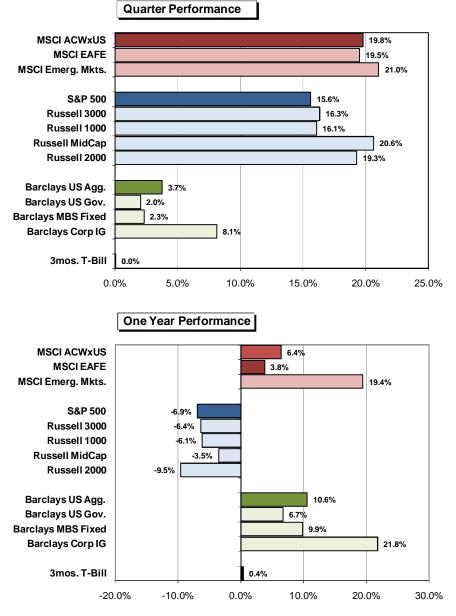

3rd Quarter 2009 Market Environment

Major Market Index Performance

Period Ended: September 30, 2009

- Both equity and fixed income markets posted strong results for the quarter ended September 30, 2009. However, evidence of the recent financial crisis is still very visible in the 1-year performance of the domestic equity indices.
- Outside of the United States, emerging markets once again outpaced developed markets during the quarter. While the performance differential for the quarter is small (+1.5%), the 1-year differential of +15.6% is substantial.
- Domestic smaller capitalization issues, represented by the Russell 2000 (+19.3%) and Russell MidCap (+20.6%) indices, respectively, exceeded large cap issues for the quarter. However, the dominance of small and midcap indices reflected in the 3rd quarter performance diverges over the 1-year period. During this timeframe, the Russell 2000 posted the weakest domestic equity index performance (-9.5%) while the Russell MidCap index posted the strongest (-3.5%) relative result.
- The Barclays aggregate return of +3.7% for the quarter was dominated by the continued recovery in credit as the Barclays Corporate Investment Grade index returned an impressive +8.1%. For the trailing 1-year period, the Barclays Aggregate posted a strong +10.6% return, which easily outpaced the majority of both domestic and international equity indices.

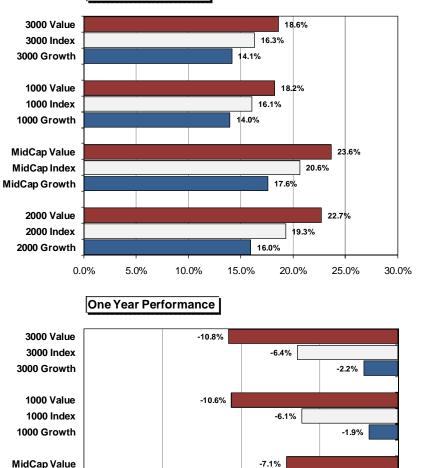

Domestic Equity Style Index Performance

Period Ended: September 30, 2009

- Led by the continued recovery in financial issues, value indices outpaced their growth counterparts by 5.4% on average for the 3rd quarter. The financial sector, which represented more than 25% of each of the Russell value indices at the end of the quarter, was the largest contributor to value index outperformance.
- The 5.4% average differential between value and growth index results for the 3rd quarter were much larger than the 1.5% average experienced between the style indices during the 2nd quarter. However, regardless of a portfolio's particular style allocation, much like last quarter, the 3rd quarter's domestic equity performance represented a welcome relief to portfolios that continue to rebuild from a historically difficult period for long-term investors.
- The strength of value indices that is evident in the 3rd quarter's results disappears and reverses in the 1-year performance of the value benchmarks. This weakness in the 1-year results is the impact of the market crisis, particularly in the financial sector, and is visible across the capitalization spectrum in the value index returns.

GICS Sector Performance & (Quarter-End Sector Weight)

Period Ended: September 30, 2009

- Large cap stock performance was positive across all ten GICS (global industry classification standard) sectors with five of the index's ten sectors outpacing the +16.1% return of the Russell 1000.
- The financial sector returned of +24.9% for the quarter, which was the strongest sector of the Russell 1000 index. This was the second consecutive quarter of top performance for the financial sector, which is now up more than 50% over the last 6-months. However, the financial sector's steep decline is still evident in the 1-year sector performance of -22.3%.
- The strength of 3rd quarter returns in the consumer discretionary (+20.5%) and information technology (+17.2%) sectors were enough to push the trailing 1-year results of both sectors into positive territory.
- Small cap stock performance was also positive across all ten GICS sectors with the energy (+27.9%), materials (+36.1%) and consumer discretionary (+26.4%) sectors finishing well ahead of the +19.3% return of the Russell 2000 index.
- The combination of a strong 3rd quarter of 2009 being added and a weak 3rd quarter of 2008 falling off resulted in the performance of the materials (+5.0%) and information technology (+9.1%) sectors of the Russell 2000 index turning positive for the 1-year period.

Quality Rankings* Breakdown by Weight and Quarterly Performance

Period Ended: September 30, 2009

- Within the Russell 1000 index, the performance by each of the quality segments was more equally distributed than the 2nd quarter where lower quality issues dominated performance. The only rating segment of the index to show noticeably weaker results than the broad index return of +16.1% during the current quarter was stocks in the "A-" category, which returned +9.2%.
- Unlike the large cap index, the "performance by quality" of the small cap Russell 2000 index continued to be led by lower quality issues. Stocks rated "C" and "D" within the index returned +30.7% and +75.7% ,respectively, for the 3rd quarter.

| Russell 1000 Quality Breakdown | Average Weight | QTR Return |

International and Regional Market Index Performance (# Countries)

Period Ended: September 30, 2009

- As the United States tries to bolster the domestic economy through its various stimulus programs, the value of the USD (U.S. dollars) continues to weaken across the globe. This USD depreciation is evident in the performance differentials of both the broad (EAFE: 4.6%) and regional segments (Pacific: 7.8%) of the international indices.
- International Markets posted strong results for the 3rd quarter, 2009 in both local currency and USD. The MSCI-EAFE (Europe, Australasia & Far East), which represents the world's 21 developed markets (excluding Canada), returned +19.5% in USD (+14.9% local). The MSCI-EM (22 emerging market countries) returned a stronger +21.0% in USD (+16.9% local). As a result, 3rd quarter results of international portfolios with emerging market holdings should benefit relative to those with holdings limited to developed market countries.
- The "one-sided" currency effect that is clearly visible in the 3rd quarter's results is not as linear when reviewing the 1-year performance. In fact, the European region of the developed markets actually show dollar strength in the 1-year period with a return of +2.3% in USD vs. +2.7% in local currency.

Country Index Performance in U.S. Dollars

Period Ended: September 30, 2009

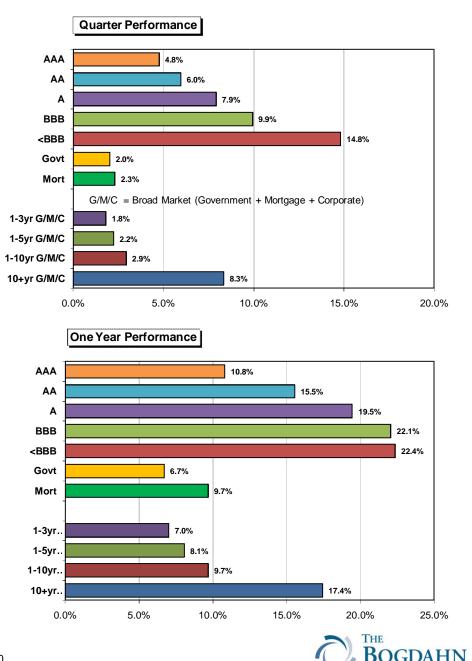

Domestic Credit Sector & Broad Market Maturity Performance

Period Ended: September 30, 2009

- Much like the 2nd quarter, the broad market index results, which consist of government, mortgage-backed and corporate securities, mask a much wider performance disparity within the fixed income market's three segments.
- Government (+2.0%) and mortgage-backed (+2.3%) results were relatively mild, but positive for the quarter. In contrast, corporate issues in all quality segments posted stronger results that were more than double the performance of the government or mortgage-backed sectors for the quarter. The outsized 1-year performance of the corporate indices, particularly high yield, are a function of the strong 3rd quarter 2009 results that were added (+14.8%) and weak 3rd quarter 2008 results (-9.5%) that were dropped from the trailing calculation.
- Although the 1-year performance of the fixed income indices in the graph appear to make a strong argument for both lower quality (+22.4%) and longer maturity (+17.4%) issues within a fixed income portfolio, one must consider where we were just 1-year ago. Memories of the volatility and fear associated with the recent crisis should remind investors that such "black and white" conclusions are rarely beneficial to long-term investors. While it is clear that fixed income investors with an appetite for risk have benefited over the last year, the performance of lower quality issues tends to be very cyclical.

Market Rate & Yield Curve Comparison

Period Ended: September 30, 2009

- The Fed left rates unchanged during the quarter as economic conditions, although still quite weak, continued to improve. The Fed also continued to reassure market participants that economic conditions would likely warrant exceptionally low rates for an extended period of time.
- As a result of the general stability of the financial markets during the quarter, many of the market's spread levels and "fear" gauges continued to contract from historically wide levels.
- The Treasury yield curve declined moderately across the maturity spectrum during the third quarter. The benchmark 10-year Treasury finished the quarter with a yield of 3.31%. This yield represented a decline of 22 basis points from the yield at the end of the 2nd quarter (3.53%).
- The last day of the 3rd quarter marked the start of the much anticipated PPIP (Pubic-Private Investment Program). The program to purchase the legacy (troubled) mortgage-backed assets of banks started with an initial value of \$4.5 billion, 25% of which came from private investors.

Assessing the Impact of the S&P 500 Decline & the "Cruelty of Math"

Period Ended: September 30, 2009

- The SPX Index measures the daily price change in the S&P 500 (excluding dividends). The CBOE Volatility Index (VIX) is a measure of market expectations of nearterm volatility conveyed by S&P 500 stock index option prices. It acts as a barometer of investor sentiment and market volatility.
- After reaching a peak of 1,565.15 on 10/9/07, the SPX fell to a low of 676.53 on 3/9/09. This drop of 888 points on the index represented a loss of 56.8% from its peak. This decline, particularly as the financial crisis reached its crescendo, included a significant increase in market volatility as measured by the VIX.
- From the 676.53 low on 3/9/09, the SPX index rose to 1,057.08 by the close of the 3rd quarter. This 380 point gain from the low represented a return of 56.3%. As would be expected, this equity market gain was coupled with a reduction in investor pessimism as the VIX decreased to a more historical level.
- Despite a more than 50% gain since its low, the index remains 580 points or 48.1% below its peak level. We call this phenomenon the "cruelty of math" in that a drop of 50% in value requires a gain of 100% to reach its original level.
- In order to put the magnitude of the market's decline in perspective, the lower table illustrates the annualized return that the SPX will be required to post from its 9/30/09 level to the previous peak of 1,565.15.

How Quickly Can the Economy Recover from a Recession?

Period Ended: September 30, 2009

- The Gross Domestic Product (GDP) of the United States is measured by the combination of personal consumption expenditures, gross private (business) investment, government consumption expenditures & investment and net exports. While the National Bureau of Economic Research (NBER) defines the official beginning and end of an economic recession* based on several factors, a recessionary period is commonly defined as two consecutive quarters of negative GDP growth.
- The decline in housing values, the tightening of consumer credit conditions, the reduction in household wealth, and a deteriorating employment outlook have all combined to cause a reduction in personal consumption.
- While the Government can provide temporary boost to GDP through various relief programs or direct stimulus, it is clear than personal consumption (70.7%) is the main driver of economic growth.
- Although the NBER has not declared the recession officially over, many experts, including Fed chairman Bernanke, have stated that the current recession has passed. However, given the length and magnitude of this recession, combined with high unemployment, low capacity utilization and various other factors, it is likely that the ultimate recovery in economic growth will be measured.

*In December of 2008, the NBER officially declared that the current recession began in December of 2007.

Statistics Definitions

| Statistics | Description |
|---------------------|---|
| Return | Compounded rate of return for the period. |
| Standard Deviation | A statistical measure of the range of a portfolio's performance, the variability of a return around its average return over a specified time period. |
| Sharpe Ratio | Represents the excess rate of return over the risk free return divided by the standard deviation of the excess return. The result is the absolute rate of return per unit of risk. The higher the value, the better the product's historical risk-adjusted performance. |
| Alpha | A measure of the difference between a portfolio's actual returns and its expected performance, given its level of risk as measured by beta. It is a measure of the portfolio's historical performance not explained by movements of the market, or a portfolio's non-systematic return. |
| Beta | A measure of the sensitivity of a portfolio to the movements in the market. It is a measure of a portfolio's non-diversifiable or systematic risk. |
| R-Squared | The percentage of a portfolio's performance explained by the behavior of the appropriate benchmark. High R-Square means a higher correlation of the portfolio's performance to the appropriate benchmark. |
| Treynor Ratio | Similar to Sharpe ratio, but focuses on beta rather than excess risk (standard deviation). Represents the excess rate of return over the risk free rate divided by the beta. The result is the absolute rate of return per unit of risk. The higher the value, the better the product's historical risk-adjusted performance. |
| Downside Risk | A measure similar to standard deviation, but focuses only on the negative movements of the return series. It is calculated by taking the standard deviation of the negative quarterly set of returns. The higher the factor, the riskier the product. |
| Tracking Error | A measure of the standard deviation of a portfolio's performance relative to the performance of an appropriate market benchmark. |
| Information Ratio | Measured by dividing the active rate of return by the tracking error. The higher the Information Ratio, the more value-added contribution by the manager. |
| Consistency | The percentage of quarters that a product achieved a rate of return higher than that of its benchmark. The higher the consistency figure, the more value a manager has contributed to the product's performance. |
| Excess Return | Arithmetic difference between the managers return and the risk-free return over a specified time period. |
| Active Return | Arithmetic difference between the managers return and the benchmark return over a specified time period. |
| Excess Risk | A measure of the standard deviation of a portfolio's performance relative to the risk free return. |
| | |
| Up Market Capture | The ratio of average portfolio return over the benchmark during periods of positive benchmark return. Higher values indicate better product performance. |
| Down Market Capture | The ratio of average portfolio return over the benchmark during periods of negative benchmark return. Lower values indicate better product performance. |
